The 900-day-old average radius of epiphyseal cupping caudal (13.12 ± 1.65 mm) with respect to the tubercle was larger than cupping cranial (10.35 1.29 mm) to the tubercle. This difference (2.75 mm), 95% CI [1.10, 4.42] was statistically significant (5) = 4.27, P = .008, with a large effect size (= 1.74).

Effect size table with Choyn's d score and Choyn's r score.

The average radius of epiphyseal cupping cranial with respect to the tubercle increased from 120-days-old (Mdn = 6.18 mm) to 900-days-old (Mdn = 10.4 mm). A Mann-Whitney test indicated this difference (4.23 mm) was statistically significant, 95% CI [1.10, 5.60], U(6 = 6, N(28 = 8), z = 2.58, P = .008, with a large effect size (= 70).

No difference could be detected for the average radius of cupping caudal with respect to the tubercle from 120-days-old (11.38 ± 0.79 mm) to 900-days-old (13.81 ± 1.65 mm). The difference of 1.73 mm, 95% CI [-0.007, 3.46] was not statistically significant (6.74) = 2.37, P = .05, with a large effect size (d = 1.41).
